Project Name	FitBuddy – AI-Powered Fitness Planner
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization – FitBuddy

This board outlines the structured brainstorming and prioritization process for FitBuddy, an AI-powered fitness plan generator using Gemini models. The team explored core features, enhancements, and future scope ideas, and prioritized them based on user impact and technical feasibility to define a clear MVP and development roadmap.

Step 1: Team Gathering, Collaboration, and Problem Identification

The initial stage of the ideation process involved collaborative discussions among team members to identify a relevant real-world problem in the fitness and health domain. The objective was to understand the difficulties faced by individuals attempting to maintain a structured fitness routine without professional guidance. After evaluating multiple problem areas, the team selected the challenge of **personalized workout planning and fitness guidance** for beginners and individuals with limited time.
Many individuals aspire to improve their physical health, lose weight, or build muscle, yet they struggle to follow consistent workout routines. Beginners often lack the knowledge required to design effective exercise plans tailored to their personal goals, fitness level, and available time. In addition, most online fitness resources provide generic advice that does not adapt to individual progress or preferences.
Furthermore, many existing fitness platforms require expensive subscriptions or professional trainers to obtain personalized workout plans. This creates a barrier for students and working professionals who seek affordable and accessible fitness guidance. As a result, users frequently experience confusion, lack of motivation, and inconsistency in maintaining their fitness routines.
To address these challenges, the team formulated the following guiding question:
How might we design an intelligent system that automatically generates personalized workout plans and adapts them based on user feedback without requiring a personal trainer?
This question became the foundation for the development of **FitBuddy**, an AI-powered workout planning system.

Step 2: Brainstorming, Idea Generation, and Concept Development
Following the identification of the problem statement, the team conducted a structured brainstorming session to generate possible solutions and system features. The brainstorming

phase encouraged open idea sharing and exploration of both technical and user-experience improvements that could enhance the effectiveness of the proposed system.

During this stage, the team proposed several ideas related to automated workout plan generation, AI-based personalization, user feedback mechanisms, and progress tracking. The primary concept was to develop a system capable of generating **personalized seven-day workout plans** based on user inputs such as age, weight, fitness goal, and preferred workout intensity.

The team also explored the integration of **artificial intelligence models** to analyze user feedback and dynamically update workout plans. This would allow the system to adapt recommendations based on user experience, improving the relevance and effectiveness of generated routines.

Additional ideas included incorporating nutrition and recovery guidance to support overall health, as well as storing user plans in a database to maintain workout history. The team also discussed potential visualization features such as progress dashboards and workout tracking systems that could help users monitor improvements over time.

Through brainstorming and idea grouping, the team identified three main functional areas for the system:

1. **Core Workout Planning Features** – generation of personalized workout plans based on user data and goals.
2. **Adaptive Feedback Mechanisms** – the ability for users to provide feedback that allows the system to regenerate or improve existing plans.
3. **Health Guidance and Tracking** – additional recommendations such as nutrition tips, recovery advice, and progress monitoring.

These ideas formed the conceptual foundation for the FitBuddy system.

Step 3: Idea Prioritization and MVP Definition

After generating multiple potential features, the team evaluated them using an **impact versus feasibility approach**. The purpose of this step was to determine which ideas should be implemented in the initial version of the system and which could be considered for future development.

Features that offered the highest user value while remaining technically feasible were prioritized for the **Minimum Viable Product (MVP)**. These core features included collecting user fitness information, generating personalized workout plans using artificial intelligence, allowing users to submit feedback to refine their plans, and storing workout plans in a database for future reference.

Other enhancements, such as workout history visualization, advanced progress dashboards, and more sophisticated personalization algorithms, were identified as important improvements but were considered secondary to the primary functionality of the system.

Several innovative ideas—including wearable device integration, mobile application support, and an AI fitness chatbot assistant—were classified as long-term future developments. While these features could significantly enhance the system, they require additional technical complexity and integration efforts.

The prioritization process ensured that the development of FitBuddy focused on delivering the most impactful functionality first while maintaining a clear roadmap for future expansion.

Outcome of the Ideation Phase

The ideation phase successfully transformed the initial problem statement into a structured solution concept. Through collaborative brainstorming and systematic prioritization, the team defined the core architecture and functionality of **FitBuddy**, an AI-powered workout planner designed to generate personalized exercise routines and adapt them using user feedback.
This process established a clear development direction and provided a well-defined feature set for the implementation phase of the project.
